ESC201A Assignment 2

Instructor Abhishek Gupta

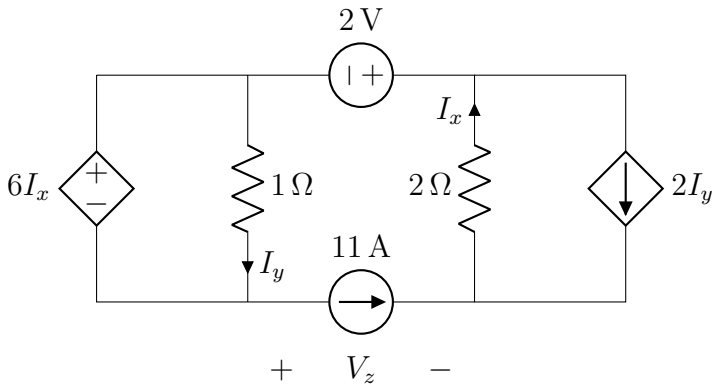
2023-2024 Semester I

Topics

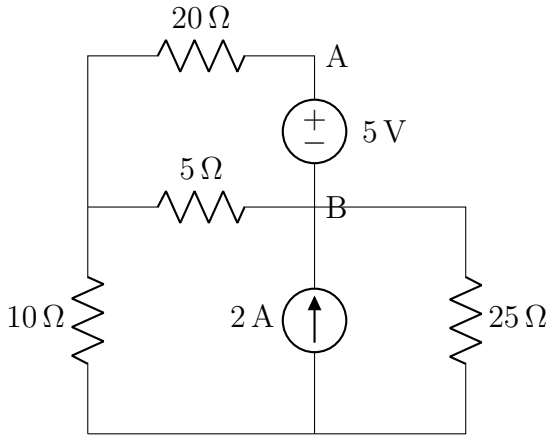
Superposition, Nodal/Mesh analysis, Thevenin/Nortan equivalent, Power

Questions

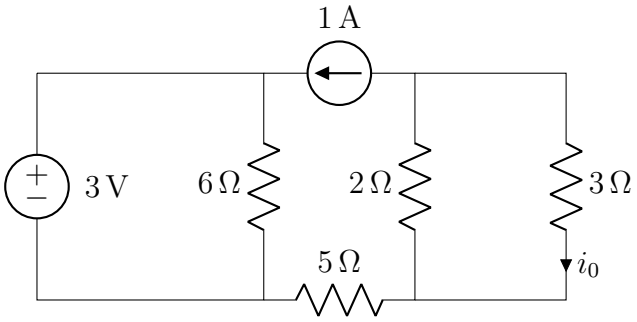
1. Determine I_x, I_y and V_z using superposition:



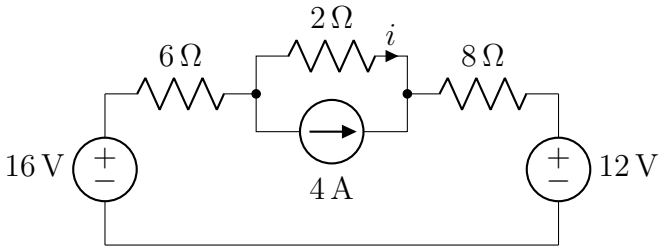
2. Determine the power supplied by the 5V source using
   (a) Mesh analysis
   (b) Nodal analysis
   (c) Superposition principle
   (d) Thevenin's equivalent circuit between terminals A and B.



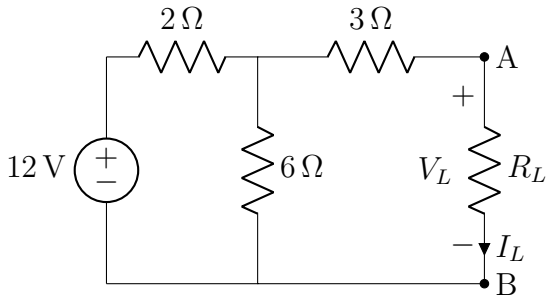
3. Use Thevenin's theorem to determine i_o.



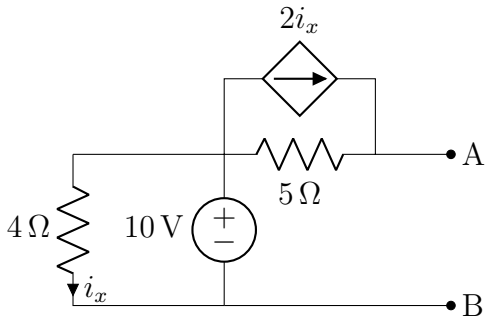
4. Determine current i through 2Ω resistor by building Thevenin's equivalent for the rest of the circuit.



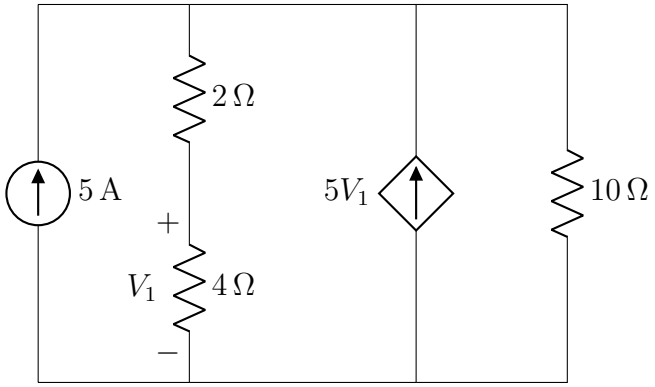
5. Find Voltage V_L across the load resister R_L, and the current I_L flowing through the load resistor R_L, in the below circuit, by using Norton's Theorem. Where $R_L = 1.5\Omega$.



6. Find the Norton resistance R_N, and the Norton current I_N, at the terminals $A - B$.



7. Determine the power dissipated in the 10Ω resistor in the following circuit



8. A practical current source provides $10W$ to 250Ω load and, $20W$ to 80Ω load. A resistance R_L with voltage v_L across it, and with current i_L through it, is connected to the source. Find the values of R_L, v_L, and i_L if,
   (a) $v_L.i_L$ is maximum.
   (b) v_L is maximum.
   (c) i_L is maximum.

9. Determine the value of R_L in the below circuit, such that maximum power is delivered into R_L. Calculate the value of the maximum power.
